

Installation Instructions

Painting Light "Maximus" Duo LED

Note! As a matter of principle, electric lights may be installed only in a currentless and cold condition by qualified electricians. Replacement of the lamp must also take place in this condition.

Assembly of the light:

Arrange the light bracket on the back of the painting frame, and secure it with the included fastening clips.

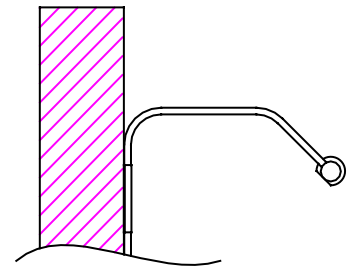

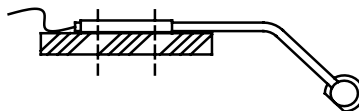

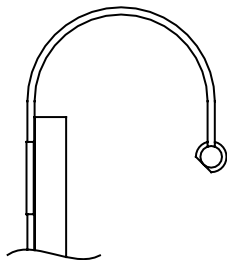

Electrical connection:

Connect the cables from the bracket to the LED terminal in the reflector. Fasten (Red = + / Black = -). Connect the cables from the brackets to the ballast with correct polarity. (Red = + / Black = -) The power cable must be on the ballast 230V terminal.

Mounting:

Align the light tube parallel to the picture frame's inner edge, and tighten the fastening clip. The light can be made operable after hanging the painting. The protective conductor is dispensed with when operating with LED. The light tube can be arranged via rotation such that the light's top edge is parallel with the frame's inner edge.

Care and maintenance:

The light is made of high-quality materials coated with an enamelled protective varnish. Clean the exterior only in a currentless condition using a cloth without chemical additives.
